

**These are the assignment requirements (Homework 5):**

**1. Open the specification.**

→ Review the document containing the functional requirements of the application.

**2. Apply the *informal review* technique to discuss the requirements.**

→ Informal review means carefully reading the document (individually or with a group) to detect any unclear, missing, or incorrect requirements, without using a structured review process.

**3. Note all questions, errors, inaccuracies, or ambiguities in the requirements.**

→ Make a list of everything that seems wrong, confusing, or incomplete in the specification.

**4. Apply the *role-based review* technique to discuss the requirements.**

→ Use different user perspectives (e.g., end user, tester, developer, accessibility expert) to evaluate the requirements. Ask yourself: how would someone in this role interpret or be affected by each requirement?

**5. Note all questions or potential user issues.**

→ From the different roles' point of view, write down all possible usability problems or questions that might arise.
